.06 Mileage Between Rate Centers

For purposes of determining airline mileage, vertical and horizontal grid lines have been established across the United States and Canada. The spacing between adjacent vertical grid lines and between horizontal grid lines represents a distance of one coordinate unit. This unit is the square root of 0.1, expressed in statute miles. A vertical (V) and a horizontal (H) coordinate is computed for each local exchange company primary serving office and serving office from NNC latitude and longitude location by use of appropriate map-projection equations. A pair of V-H coordinates locates a primary serving office or serving office for determining airline mileage, at a particular intersection of an established vertical grid line with an established horizontal grid line. The distance between any two primary serving offices or serving offices is the airline mileage computed as explained below.

To determine the rate distance between any two primary serving office or serving offices, proceed as follows:

1. Obtain the "V" and "H" coordinates for each local exchange company primary serving office or serving office.
2. Obtain the difference between the "V" coordinates of the two primary serving offices or serving offices. Obtain the difference between the "H" coordinates.

NOTE: The difference is always obtained by subtracting the smaller coordinate from the larger coordinate.
